

Importing data from a CSV file

This section allows you to import articles in bulk from CSV file. By default, CSV import page is displayed. CSV stands for **Comma Separated Values**, sometimes also called as **Comma Delimited** is a specially formatted plain text file which stores spreadsheet or basic database information in a very simple format, with one record on each line, and each field within that record separated by a comma.

Expand **Tools** in left navigation bar and click on **Import Data** to import CSV data.

Import using CSV file is a two step process. You can move to the second stage after successful completion of the first stage. At stage one, specify different import options as shown in the figure below.

The screenshot shows the 'Import Options' form for English. It has a title bar with a close button and a language indicator 'EN'. Below the title bar is a 'Select article type' tooltip. The form contains the following fields:

- Article Type ***: Radio buttons for **Public** (selected) and **Private**.
- Import Into ***: A dropdown menu showing 'Digital Signal Processing'.
- Import As ***: A dropdown menu showing 'Approved'.
- Delimiter ***: A dropdown menu showing 'Comma , '.
- First Line Contains Field Names**: A checked checkbox.

Article Type: If **Public** is checked, the articles are imported into the public categories and if **Private** is marked, the articles are imported into the private categories.

Import Into: Select the category into which the article(s) should be imported. Please take into consideration that in ML editions of software, categories of the language selected in language drop-down are displayed only.

Import As: Select the status (Approved, Pending, Disapproved, Draft, Featured) where the article is to be imported.

Delimiter: PHPKB allows three types of separation among fields in CSV files: Comma (,), Pipe Symbol (|), tab (\t). If the first line of the imported file contains field names, then check **First Line Contains Field Names** option.

The screenshot shows the 'Step 1 (Specify CSV Source File)' form. It has a title bar with a close button. The form contains the following elements:

- Import from a file [Recommended for large scale import]**: A selected radio button. Below it is a file selection box with a 'Choose File' button and the text 'No file chosen'.
- Import using copy/paste [Recommended for small scale import]**: An unselected radio button.
- Next** and **Cancel** buttons at the bottom.

Import From a File: If this option is checked, you can use CSV file stored in your system for a large scale import. The CSV file you use should contain following details:

Each record should have two mandatory fields - Title and Content. Keywords, Summary, Description are optional fields.

Fields should not be in same order.

If CSV file contains filed headers, they should be in the first line of the file.

Only text/plain or text/CSV or text/comma-separated-values or application/csv or application/excel or application/vnd.ms-excel or application/vnd.ms-excel files may be uploaded.

If your text/plain or text/csv file field contains double quotes then you must preface these interior quotes with a back slash (\) in order to differentiate them from quotes defining the start and end of field contents.

Click "**Choose File**" to select a file from your system to import.

Import Using Copy/Paste: If this option is checked, you can write or copy/paste the comma separated contents directly into the text box area below this option (displayed once you check Import using copy/paste option).

Click "**Next**" button to continue to next step.

The second step allows you to synchronize fields in CSV file with the article fields of the knowledge base.

Step 2 (Map Field Names)

CSV Fields	Map Into Fields
title	Do not synchronize t ▼
content	Do not synchronize t ▼
keywords	Do not synchronize t ▼
summary	Do not synchronize t ▼

[Import Now](#)

CSV fields column displays fields found in CSV file and **Map into Fields** column has select drop-downs with options article title, article content, article keywords and article summary in each drop-down. You need to choose the relevant option from the drop-down that matches with the specified field of your CSV file. For example, the CSV field title is the name of the article so **Article Title** option should be selected in the corresponding select drop-down.

Note that Title and content fields are mandatory to be mapped in order to proceed with CSV process.

If you **do not synchronize** other fields of your CSV, fields will simply be ignored and it will not be stored in the database.

After mapping the fields click on "**Import Now**" button to import the articles. Articles Imported Status screen will be displayed as shown below:

Articles importing from the CSV file.
