This brief tutorial will teach you how to install and configure ionCube loaders on Microsoft Windows Server. The evaluation copy of PHPKB knowledge base software has encoded source code and it requires ionCube loaders to be installed on the web server where it is to be tested. You can get the loaders from ionCube website. We strongly suggest to read the [ionCube loaders installation guide](#). The purchased license of PHPKB software will come with full source code that is not encoded and that does not require installation of ionCube loaders.

## 1. Download ionCube Loader

Download the [ionCube Loader](#) for Microsoft Windows. You will need to choose either a "Non Thread-Safe" or a regular version of the ionCube loader. Choose "Non-TS" if Thread Safety is disabled in your PHP configuration. To check, open up a phpinfo() file and look for:

|                     |         |
|---------------------|---------|
| Debug Build         | no      |
| Thread Safety       | enabled |
| Zend Memory Manager | enabled |

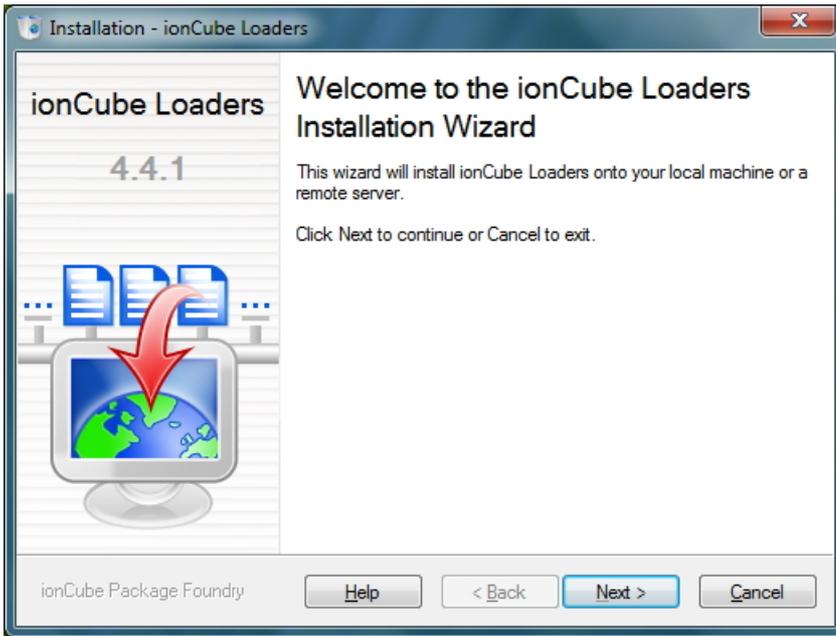

Your choice of ionCube Loader will also depend on the compiler used to create the PHP installation on your web server. Again, you can find which version this is in a phpinfo() file. The compiler with either be VC 6 or VC 9.

|              |                         |
|--------------|-------------------------|
| Build Date   | Aug 23 2011 11:47:20    |
| Compiler     | MSVC9 (Visual C++ 2008) |
| Architecture | x86                     |

 The ionCube loaders are available only for 32-bit Windows platform. In order to install the ionCube Loader on 64-bit Windows platform, you will need to configure IIS server to run 32-bit applications.

## 2. Installation of ionCube Loader

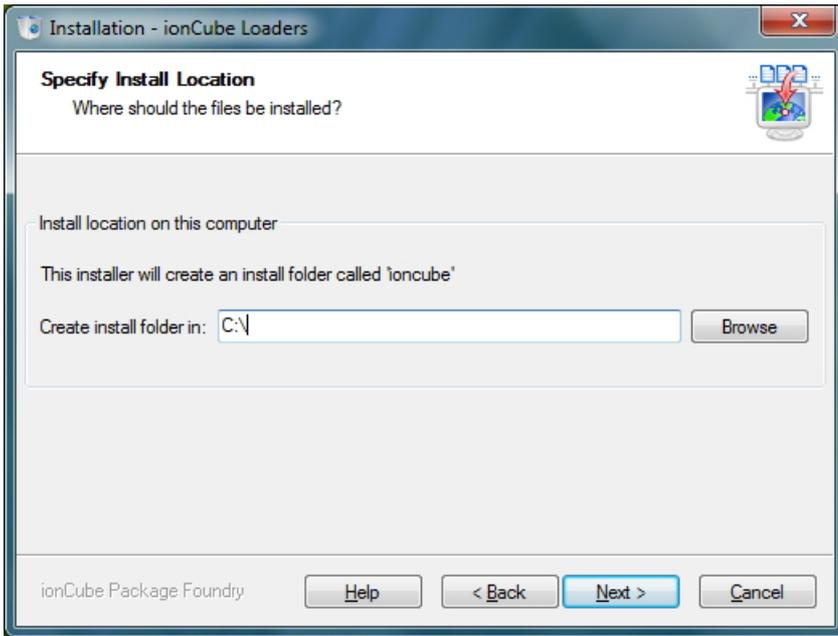

Start the installation process by double clicking the downloaded loader installer.

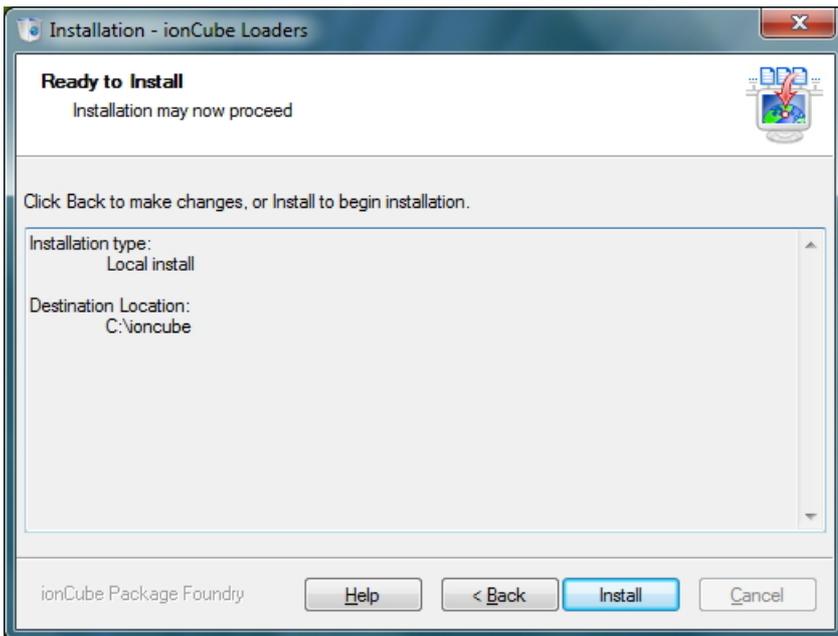

Click Next, Select "Installation Type" as "Install to this machine" to install the loaders on your local server.

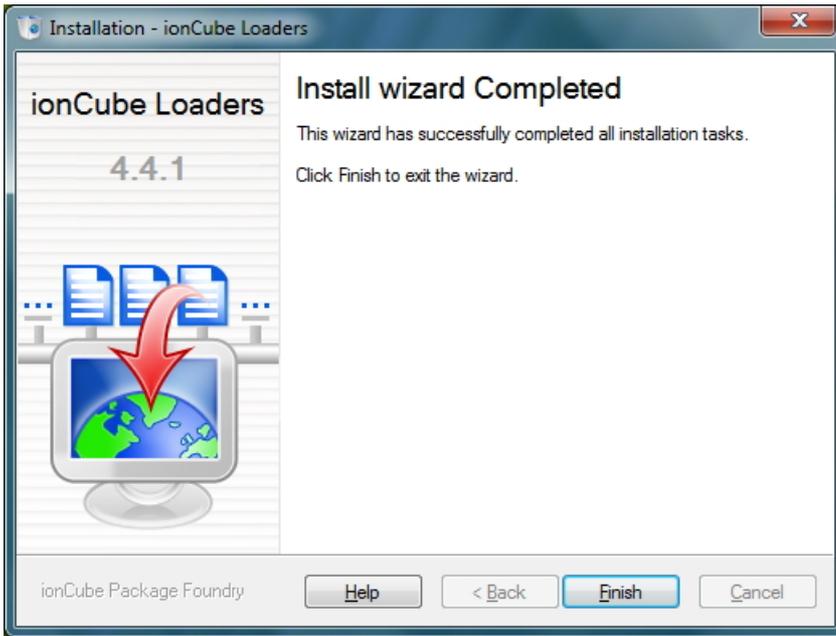

Click Next, Specify an "Install Location". We specified "C:\\" in our case to install the ionCube loaders in C drive of our server.

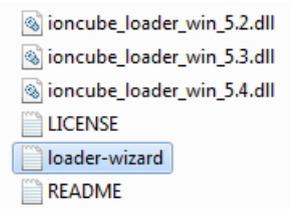

Click Next, review your installation parameters and click on "Install" button to start the installation.

Once the installation process is completed, you will see the screen below. Click on the "Finish" button to close this window.

**Very Important Step:** After installation process is completed, copy the file "loader-wizard.php" present in the ionCube install directory (as shown below) to the document root of your web server.

Now, open it in your web browser (for example, <http://localhost/loader-wizard.php>). This web page will analyze your web server and produce a tailored set of installation instructions as shown below.

## ionCube Loader Wizard

Please note that the following problem currently exists with the ionCube Loader installation:

- The necessary zend\_extension line could not be found in the configuration.

To use files that have been protected by the [ionCube PHP Encoder](#), a component called the ionCube Loader must be installed.

For a **local** server you should install the ionCube Loader using the `php.ini` configuration file. ([Please click here if you are not on a local server.](#))

### Installation Instructions

1. Download one of the following archives of Windows VC9 x86 Loaders:
  - [zip](#)
  - [MS Windows installer](#)

Please note that the MS Windows installer version is suitable either for direct installation on a Windows machine or for uploading from a local PC to your server.  
A Loaders archive can also be downloaded from <http://loaders.ioncube.com/>.
2. Put the Loader files in `G:\xampp\php\ioncube`
3. Edit the file `G:\xampp\php\php.ini` and **before** any other zend\_extension lines ensure that the following is included:
 

```
zend_extension = "G:\xampp\php\ioncube\ioncube_loader_win_5.3.dll"
```

Alternatively, replace your current `G:\xampp\php\php.ini` file with [this new php.ini file](#).
4. Restart the Apache server software.
5. When the server software has restarted, [click here to test the Loader](#).

You will need to add necessary `zend_extension` line in your `php.ini` configuration file.

### 3. Confirm Installation

Now, restart the web server and confirm if the installation is successful by accessing the `phpinfo()` of the server.

This program makes use of the Zend Scripting Language Engine:
